

## First run loop, doesnt save eve settings

Posted by muggelle - 2020/01/25 15:18

---

Hi Slav2,

as the title said, EP at first run starts eve fine and makes all the settings needed, but eve doesn't save the settings and quits after all is done.

EP starts eve and begins all over again.

it sounds like an eve problem, but eve does save my settings after I changed it ingame. eve doesn't if started over EP.

One time it did save the settings, but needed to change something and now stuck in first run loop again because of eve not saving settings

running EP as admin on win10

thanks in advance

I have the same issue right now on VMware, I can save settings myself, but first run is resetting settings and doing everything again until it doesn't work anymore and every time I restart it says that first time run failed.

Usually EVEPilot turns off and my EVE online client is on settings screen, and one time both of the applications were closed.

EDIT: I followed Troubleshooting at this link

<http://www.macrolab-online.com/knowledgebase/index.htm#page=vmware.html> , and one of those suggestions have fixed my issues.

I cannot explain this. If eve is closed new settings should appear in settings folder. Bot is waiting a few seconds after setup and before settings updated. Try to disable your antivirus program first. Contact me via telegram in case you still need to find a solution.
