

Issues with bot in VM

Posted by Killara - 2021/09/07 12:34

Alright, so I've got the bot running (somewhat) and I managed to get a first run completed. The bot was making lots of misclicks, wasn't dragging windows to proper sizes so it had to retry 10+ times on nearly every drag/drop to resize windows. It even got hung up making shortcuts once or twice. After lots of trail/error I finally got it to mine some but I could tell it was having an extremely hard time due to the numerous misclicks.

I finally went into the HELP section and did everything (disable drag/drop & copy/paste, deinstalled vmware tools, set to dx9, and even changed the shared settings bit).

The only two things I didn't do was the registry edit bit and disabling the mouse by editing the VMX file. I have two questions before trying that.

1. Do I need to reload the snapshot I took before running VMsetup? The registry is already saying I have a gt 430.
2. How do I go about starting the bot without mouse functionality? I already have my VPN autostart and autoconnect so that isn't an issue. I would prefer the bot not start for around 5 minutes after windows launches due to the VPN needing some time to auto connect.

Edit: Forgot to say, when I'm watching the bot run I see everything happen so slowly. For instance when it clicks on the station on the overview it takes between 5 and 10 seconds to register on the "selected item" box.

Manual is a bit outdated, need to add a line in vmx file to get rid of mouse lags:

```
monitor_control.virtual_rdtsc = "FALSE"
```

Check and report.

VMSetup create a task on windows start to update and start bot auto. I usually find a key runonce and switch to key run in registry. Edit startup parameter /X to increase startup time if necessary.

In shared settings->error corrections disable exterior view on start

Added the line and everything seems to be running as it should. The game isn't lagging at all, I haven't noticed any misclicks, it warped to bookmarks and locked targets and started mining without wasting any time.

I didn't add the lines to disable the mouse. I had already ticked the box to disable the exterior view. It seems adding that single line fixed it. Much thanks Slav.
