

question

Posted by Ivaldi - 2014/01/11 17:58

hi , i have 3 question.

1)is there any option which permits you to leave from an anomaly if a blue/ally is already present in there?

2)If I want to select a certain anomaly (patrol/horde) how do I do that?

3)Is there any way to select a priority of targets in the anomalies? Like I want the bot first to fire on the turrets then frigates and then cruisers.

thanks,

=====

1) Close local scan is not used. You may try to use general avoid PC function. This will work with all standings besides if you edit overview filter manually to show pluses and ally ships only in avoid overview preset.

2) Activate using keywords to search for anomaly. This option described in the manual.

3) By hull type - no. You may set priority mode for NPCs with some properties (webbing, scrambling etc). If I am not wrong, turrets should have higher priority if no other priority NPCs defined.

I did not understand the answer to the first question

I have problem, when I do ratting in anomaly, the first time the scan is good and takes the bookmark, but when he finished not take a new one and continues to warping of the.

came to me and (another) problem, since I have this problem with the anomaly, I was a bot belt, went smoothly at the beginning, but now I just warping to the first bookmark them and remains stationary.

1) Close local scan or detection of standings in overview is not used. Bot may avoid all ships if you define to do so. There is a practice to remove fleet members from overview to not avoid fleet members. Your task is similar. I did not try, but I think it is possible to set an additional filter in overview to show ships with required standing only. This is not standard settings, you will need to pause bot during first

run, create and apply filter to avoid overview preset and unpause bot to finish first run. Then you may use avoid PC function and avoid pluses and allies on warp to anomaly.

I have problem, when I do ratting in anomaly, the first time the scan is good and takes the bookmark, but when he finished not take a new one and continues to warping of the. came to me and (another) problem, since I have this problem with the anomaly, I was a bot belt, went smoothly at the beginning, but now I just warping to the first bookmark them and remains stationary. Need to check logs. First problem is not clear w/o log. Second - if you used anomalies and started to use belts, need to check max bookmarks value.

where increasing the number of bookmarks? do you think there is much difference between ratting isk in belt and anomaly? (With tengu) there also a few options for chaining the belt? thanks

In hunt bot settings you increase the number of bookmarks to use. If you hunt in anomaly you use just 2 bookmarks. If you hunt in belts, you need to set proper max bookmarks number.

Now the belt ratting in work perfectly when I put anomaly has to do is want it to do patrol squad and I have to put *patrl +squad is correct? when the ends and takes another bookmark overwrites it? thanks

If you want to use patrol squads only, add keyword

+Patrol Squad

if you add this set of keywords:

*Patrol
+Squad

Bot will do any Squads as a priority site, then, when no Squads left, any anomaly with Patrol in the name.
