

Bot doesn't do EWO

Posted by Kolerazie - 2018/06/06 17:36

If the bot sees a enemie on the d-scan he did not warp to the safe spot. He first looks for the next system he can go to with the mail and then he gets usually killed in the site.

Really? Bot warps to safe spot besides after completion of the mission. I may add warp to safespot in all cases, but chances that you get caught after mission completion is very low (your beacon should disappear from scanner already). If you will reproduce this, record log file and send it to me.

it happens during the mission in the site as soon as he sees an enemy on the d-scan

Check video at 5:40. Compare mouse speed. You may need to increase it till 7 and reduce delays. If somebody was fast enough to enter gate and warp scramble you bot will also try to set destination while in combat.

Also bot could make bookmark too close to the complex and fail to warp. Check messages. If this is the case I may add manual delay for bookmark creation after warp. Not a big problem in a long run, as bot needs only one bookmark per system.

Having the same issue. Thought first run without expanded local chat will solve the problem, but the problem was it couldn't warp to the bookmark as 'natural phenomena blocking warp'. Maybe the safespot which bot created was too close to warp.

Yes, when bookmark is created, it may be too close to the complex. This is better then situation when safespot is created in approach range to the stargate in case of a lag :) I decided to not fix it as bot is creating safespot bookmarks only once.

I think this is caused by my old bookmark folders that are on top of the EWO bookmark. I'm wiping them out and restarting first run clean.

I confirmed that sometimes EWO doesn't work because of environmental phenomenon. Probably proximity to the gate. This is OK I guess since it only happens once per system.

Sorry but I still don't know what should I do to solve this problem.

Bot doesn't use bookmark with safe spot, when FW bot finding hostile on the scanner he trying put new destination on mail and lost a lot of time. Finally ship has been destroyed.

Send me log file (check link in my signature how to record log) and screen when safespot bookmark present in the system. If bot sees SS bookmark, it uses it. Do you have too many folders in people and places?

no, only standard folders after first run, moreover when I changed "orbit range" in bot "settings to 26 kilometers he using the afterburner even when 26 km is reached. According to this situation bot doesn't finish currently mission and doesn't fly to next site....

Afterburner switched On when distance > 20km and off if distance
Send me log file and screen to check what is going on with safespot boomark usage. Wait while ship is destroyed, pause and send log to me. Bot may loose ship when safespot boomark just created and placed too close to the complex. But bot needs only one such bookmark per system and will reuse old bookmarks. So this problem is not persistent. Don't delete bookmarks and you are OK.

I ran first run again and I'll log file and screen shot when problem come up again...

P.S. I had perma capacitor with afterburner, that looks like he can't finish orbit process...

ok, after two days of tests I can say something.

Bot works without problem he "sees" the safe spot because when start in space he flying to safe spot without problem.

But in situtaion when he scan and some target is on scanner he should fly to safe spot but he avoid it and try opening the mail box and put a new destination there.

Of course it is "one way ticket" to pod - this process takes to long time :)

I checked it on many types of resolution - without suces.

Additionally when I running bot with 1024 x 768 resolution is a problem with finish the camp site - bot can't clear the local chat because he doesn't see a "clear chat button" it is of of screen range.

Please zip and resend log one more time. Set subject of your e-mail as "log files" to pass spam filter. Surprised, I did not modify algorithm since I recorded demo. As a rule destination is set during warp to SS.

Yeah, right you wrote that I should sent a mail with topic "log files" ok then Is done... you have to receive it on mailbox.

P.S. I checked it over and over, I changed PnP position, background of colours and other things. Without sucess :(

I'm wondering that other users have got that same problem.
