If a High Slot just below drones window..

Послан Suntwo - 03.04.2019 11:06

_____

If a High Slot just below drones window bot doesn't recognise drones window, and after a while do EWO to refit drones..

I had problem with my new ships fitting - it was just my destroyed ships replacement, with same fit, after docking out of station, my fit modules icon's were all messed around everypossible way, bot doesn't recgonise anything,
and to set in right possitions those module icon's to which slot belongs, that doesn't work, bot not saving any windows changes.

And there was that drones module which i can't just put anywhere, because bot not saving changes, and makes error for modules which are below drones window.

I got 2 high slots below drones window - weapons grouped and drone link.
About grouped weapons, bot then click to groupe and ungroupe weapons, contantly, not attacking npc's, only later, and later do EWO because to refite already existing drones.

 Only First Run can change How to Display Modules Positions, after undocking from station, it saves only then possitions, and after only loads, as First Run done. But losing Everytime ship, should i run First Run?

>About grouped weapons, bot then click to groupe and ungroupe weapons, contantly
Send me two screens as screen1.bmp and screen2.bmp when bot grouped and ungrouped weapons and screen of your module fitting, corresponding to this run.

Make sure that you correctly defined positions of guns/launchers in settings. Bot may group weapons, if neccessary, but position of a weapon group is random. Bot is looking for new position in slots where you defined guns/launchers only.

There is a speedy procedure to save new settings w/o first run. Start eve client with bot (to load settings). Make what you need, close eve, use copy settings locally button.
